

11-1: Introduction to Genetics

The Work of Gregor Mendel

Genetics Vocabulary

- **Genetics**

- The study of heredity.

- **Heredity**

- The passing of physical characteristics from parents to offspring

- **Trait**

- Characteristic that can be passed on to offspring
- Ex: height, eye color, hair color

Genetics Vocabulary

- **Allele** - the different forms of a trait.
 - Ex: for the “eye color” gene brown and blue are two possible alleles.
- **Gene** - factor that controls a trait; located on your chromosomes.
 - You get your genes from the set of chromosomes you get from mom and the set of chromosomes from dad!

Gregor Mendel

- In the early 1800s, a smart priest named **Gregor Mendel** experimented with **true breeding** (self pollinating) pea plants.
- He wanted to find out how the genetic traits for seed shape and pod color were passed down to new generations of plants.

Mendel's Experiment

- Mendel crossed pure yellow peas with pure green peas
- He noticed that **all the offspring were yellow**
- He then decided to cross these yellow peas with each other
- The offspring of these peas were both yellow and green

Generation

Parental (P)
(pure-breeding)

First filial

Dented

Seed color

Yellow

Green

Flower color

Purple

White

Pod shape

Inflated

Constricted

Pod color

Green

Yellow

- Performed experimental crosses with pure bred pea plants.
- Discovered that first generation offspring all showed only one of two alternate traits.
- Example: pure breeding tall crossed with pure breeding short produced **ALL** tall.

7 Pea Plant Traits

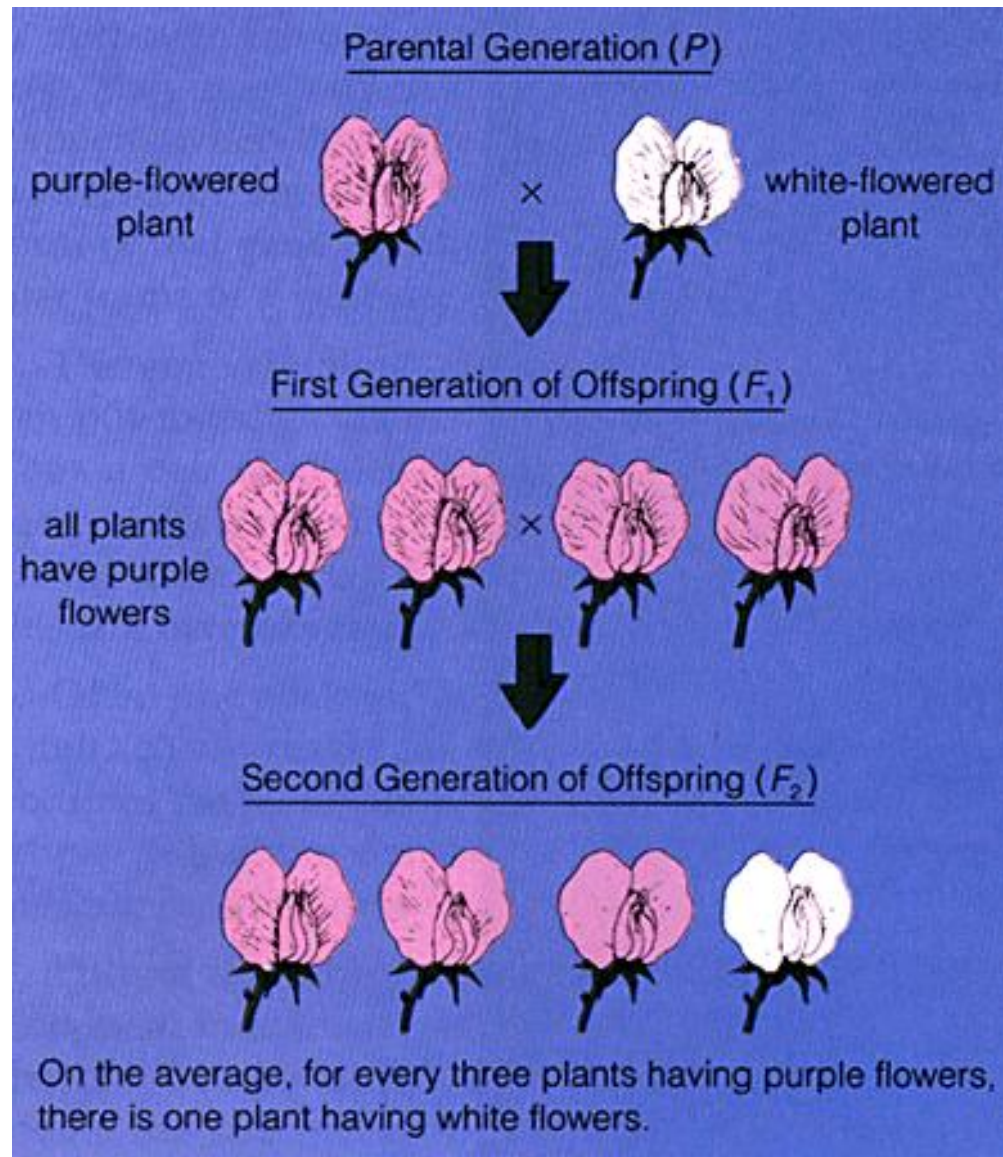

Seed		Flower	Pod		Stem	
Form	Cotyledons	Color	Form	Color	Place	Size
						
Grey & Round	Yellow	White	Full	Yellow	Axial pods, Flowers along	Long (6-7ft)
						
White & Wrinkled	Green	Violet	Constricted	Green	Terminal pods, Flowers top	Short ($\frac{1}{2}$ -1ft)
1	2	3	4	5	6	7

The Contributions of Mendel

- He demonstrated that inherited characteristics are carried by separate units that are re-assorted in each generation.

Mendel's Pea Plant Experiment

Genes & Dominance

Dominant vs. Recessive

	Seed Shape	Seed Color	Seed Coat Color	Pod Shape
P	Round  X  Wrinkled	Yellow  X  Green	Gray  X  White	Smooth  X  Constricted
F ₁	 Round	 Yellow	 Gray	 Smooth

Principal of Dominance:

- Some **alleles** are *dominant* and others are *recessive*.
- **Dominant** alleles for a trait: will *always* show that form of the trait.
- **Recessive** alleles for a trait: will show that form *only* when the dominant allele is *absent*.

Representing genes:

- For each trait in pea plants, the plant receives one allele from each parent.
 - **Yellow** is dominant for seed color we use the letter **Y**.
 - A capital **Y** represents a gene for a yellow plant.
 - A lowercase **y** represents a gene for a green plant.

Describing Traits

- There are 2 ways to describe traits:
 1. **Genotype:** the *genetic* makeup of a trait.
 1. The genotype of the offspring here would be **Yy**.
 2. **Phenotype:** The *physical* characteristic of a trait.
 1. The phenotype of the offspring would be **yellow**.

Seed Color
Yellow  X  Green
 Yellow

For Class Credit: On a separate sheet of paper. Please give me the phenotype and genotype of the four offspring below:

	1. Seed Shape	2. Seed Color	3. Seed Coat Color	4. Pod Shape
P	Round  X  Wrinkled	Yellow  X  Green	Gray  X  White	Smooth  X  Constricted
F ₁	 Round	 Yellow	 Gray	 Smooth

Yy

Yellow

Yy

Heterozygous

Hybrid

Do Now:

1. Which **trait** is being crossed between these two parents?
2. What are the two **alleles** for this trait?
3. What is a **genotype**?
4. What is a **phenotype**?
5. What is the **genotype** and **phenotype** of the offspring?

I I- 2 Probability & Punnett Squares

Probability can be used to predict genetic outcomes.

Punnett Squares and Probability

- The likelihood that a particular event will occur is called probability.
- When a gamete is produced there is a 50% chance either gamete will be selected.

	<i>T</i>	<i>t</i>
<i>T</i>	 <i>TT</i> 25%	 <i>Tt</i> 25%
<i>t</i>	 <i>Tt</i> 25%	 <i>tt</i> 25%

Probability and Segregation

- One fourth ($1/4$) of the F_2 plants have two alleles for tallness (TT).
- $2/4$ or $1/2$ have one allele for tall (T), and one for short (t).
- One fourth ($1/4$) of the F_2 have two alleles for short (tt).

	T	t
T	 TT 25%	 Tt 25%
t	 Tt 25%	 tt 25%

Punnett Squares

- We show the cross of two parents using a Punnett square.
- **Cross** = a mating between two parents.
- **Punnett square** = a chart that shows all the possible combinations of alleles that can result from a genetic cross.

Punnett Squares

- Mendel first did a cross between 2 true-breeding plants. One had yellow seeds, the other had green seeds.

Seed Color
Yellow  X 
Green 
Yellow

- **Genotype Ratio** of Offspring = _____
- **Phenotype Ratio** of Offspring = _____
- What are the chances of the offspring being **yellow**?
- What are the chances of the offspring being **green**?

Homozygous vs. Heterozygous

- Homozygous: An organism with **two identical alleles** for a trait. **YY or yy.**
- Heterozygous: An organism with **two different alleles** for a trait. **Yy.**

Yellow

YY or Yy

X

yy

Green

Answer this:

- What does it mean to be homozygous dominant?
- What does it mean to be homozygous recessive?

11-3 Exploring Mendelian Genetics

Patterns of Inheritance

Incomplete Dominance

- The heterozygous phenotype blends together.

Incomplete Dominance

RR = red flower
WW = white flower
RW = pink flower

The heterozygous phenotype blends together.

Codominance:

- The heterozygous phenotype expresses both alleles (just not together).
- In chickens: if they have an allele for white feathers **and** an allele for black feathers the chickens have both black AND white feathers.

Codominance:

	B	W
B	BB	BW
W	BW	WW

BB = Black feathers
WW = white feathers
BW = black AND white feathers

The heterozygous phenotype shows BOTH alleles.

Do Genes Affect Each Other?

- Mendel wondered if a plant with yellow seeds was more likely to also have round seeds
- He made a cross that tested for two traits:

DIHYBRID CROSS

Seed color	Yellow	×	Green
			
Seed shape	Round	×	Wrinkled
			

Mendel found that seeds could be:

- **yellow round,**
- **yellow wrinkled,**
- **green round, or**
- **green wrinkled.**

Alleles could separate from each other.

Original Parents:

Yellow Round X Green Wrinkled

Polygenic Traits

- Traits controlled by two or more genes are said to be **polygenic traits**.
- Height, skin color, hair color, eye color in humans are polygenic traits controlled by more than three different genes.

	ABC	ABc	AbC	Abc	aBC	aBc	abC	abc
ABC	AABBCC	AABBcc	AABbCC	AABbCc	AaBBCC	AaBBcc	AaBbCC	AaBbCc
ABc	AABBcc	AABBcc	AABbCc	AABbcc	AaBBcc	AaBBcc	AaBbCc	AaBbcc
AbC	AABbCC	AABbCc	AABbCC	AABbCc	AaBbCC	AaBbCc	AabbCC	AabbCc
Abc	AABbCc	AABbcc	AABbCc	AABbcc	AaBbCc	AaBbcc	AabbCc	Aabbcc
aBC	AaBBCC	AaBBcc	AaBbCC	AaBbCc	aaBBCC	aaBBcc	aaBbCC	aaBbCc
aBc	AaBBcc	AaBBcc	AaBbCc	AaBbcc	aaBBcc	aaBBcc	aaBbCc	aaBbcc
abC	AaBbCC	AaBbCc	AabbCC	AabbCc	aaBbCC	aaBbCc	aabbCC	aabbCc
abc	AaBbCc	AaBbcc	AabbCc	Aabbcc	aaBbCc	aaBbcc	aabbCc	aabbcc

1 : 6 : 15 : 20 : 15 : 6 : 1

Multiple Alleles

- Genes that are controlled by more than two alleles are said to have **multiple alleles**.
- An individual can't have more than two alleles but more than two possible alleles can exist in a population.
- For example, there are three different alleles for blood type in humans: A, B, and O.

Blood Types

- Human blood type is determined by codominant alleles.
- There are three different alleles, known as I^A , I^B , and i .
- The I^A and I^B alleles are codominant, and the i allele is recessive.

Phenotype	Genotype
O	ii
A	$I^A I^A$ or $I^A i$
B	$I^B I^B$ or $I^B i$
AB	$I^A I^B$

Blood types need to be matched prior to transfusion. If given the wrong blood type, the body might reject the transfusion.

Rh Factor

- Individuals either have, or do not have, the **Rhesus factor** on the surface of their red blood cells.
- This is usually indicated by:
 - Rh⁺ (does have the RhD antigen)
 - or 'RhD negative' (does not have the antigen)

Rh Factor	Possible Genotypes
RH +	RH+ RH+ RH+ RH-
RH -	RH- RH-
